

## Bone Anchored Hearing Solutions: Past, Present, and Future

Harold H. Kim, M.D.  
Wilson Ear Clinic  
Portland, OR

---

---

---

---

---

---

---

## Agenda

- The Concept
  - Branemark
- The beginning
  - The implants
- Now
  - The processors and accessories
- The future
  - Implants and other options

---

---

---

---

---

---

---

## Who Was This For?

- Hearing loss
  - Cochlear reserve serviceable
- No ear canal
- Chronic ear drainage
- Otitis externa

---

---

---

---

---

---

---

### Bone Conduction

---

---

---

---

---

---

---

### Bone Conduction

---

---

---

---

---

---

---

### Initial Instruments

Softband Options

---

---

---

---

---

---

---

## Osseointegration (Branemark)

"The direct structural and functional connection between ordered living bone and the surface of a load carrying implant"

---

---

---

---

---

---

---

## OSSEOINTEGRATION

- Term coined by Professor Per-Ingvar Branemark
- Discovered the ability of living tissue to integrate with titanium
- An active bond between tissue and implant is created at the molecular level
- The titanium fixture/implant is not only accepted but also incorporated within the bone

---

---

---

---

---

---

---

## Applications of Osseointegration

1965-Dental Implants

1977-Bone anchored implants for hearing

---

---

---

---

---

---

---

Dental Implant

---

---

---

---

---

---

---

Percutaneous Auditory Implant

---

---

---

---

---

---

---

Percutaneous Bone Anchored Hearing Device In Place

---

---

---

---

---

---

---

### Percutaneous Implant

---

---

---

---

---

---

---

### Benefit of Percutaneous Devices

- Sharper Sound Quality
- Greater Auditory gain
  - 10-25 dB as compared to bone conduction hearing aids.

---

---

---

---

---

---

---

### Coming to Market

- Europe-1987
- United States-1997
- Single Sided Deafness-2002

---

---

---

---

---

---

---

### Single Sided Deafness

- Criteria
  - Profound hearing loss in 1 ear.
  - Pure tone average of 20 dB or better in the better hearing side.

---

---

---

---

---

---

---

### Single Sided Deafness

- Bone anchored hearing devices (BAHD) vs. CROS systems
  - Hol et al.-3 in 4 preferred BAHD
  - Lin et al.-BAHD produced better:
    - Subjective benefit
    - Sound localization
    - Speech discrimination in quiet and noise

---

---

---

---

---

---

---

### FDA Indications for Bone Anchored Auditory Devices

- Unilateral profound SNHL with normal functioning contralateral ear.
- 2 of the following:
  - Conductive and mixed hearing loss
  - Recurrent otorrhea preventing the use of air conduction hearing aids
  - Surgically altered or malformed ear canals precluding use of air conduction hearing aids

---

---

---

---

---

---

---

### Concerns

- Torque on implant
- Depth of Skull

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Result of These Concerns

- Shorter length of abutment
- Delayed loading of processors

---

---

---

---

---

---

---

### In The Beginning

- 2 Stage Procedure
- Soft Tissue Reduction
- Exclude use in children aged under 5 years

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Soft Tissue Reduction

---

---

---

---

---

---

---

### Experience

- Staging unnecessary-1995
- Dermatome produced soft tissue problems
  - Up to 36% had abnormal healing-Van Rampaey
  - Delayed skin healing
  - Skin necrosis
  - Skin overgrowth over abutment

---

---

---

---

---

---

---

### Single Stage

- FDA Recommendation-Processor loading in 3 months
- Studies—3-5 week loading is adequate

---

---

---

---

---

---

---

### Surgical Innovations

- The Wide Fixture

---

---

---

---

---

---

---

### Multiple Sized Abutments

---

---

---

---

---

---

---

### Surgical Innovations

- Linear Incision

- Biopsy Punch

---

---

---

---

---

---

---

### Surgical Innovations

- Less soft tissue complications
- Shorter duration of surgery
- Better cosmesis

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Continued Challenges

- Continued delayed soft tissue complications
- Device extrusion/failure to osseointegrate
- Continued contraindications in children under 5 years of age

---

---

---

---

---

---

---

### Contraindications to Percutaneous Bone Anchored Hearing Devices

- Bone conduction threshold > 55 dB HL
- Speech discrimination < 60%
- Age less than 5 years
- Poor hygiene

---

---

---

---

---

---

---

## MRI Compatibility?

- Yes to 1.5 Tesla machines

---

---

---

---

---

---

---

## Processor Innovations

Was

Analog

Directional microphones

- Fixed and manual

---

---

---

---

---

---

---

## Contemporary Processor

---

---

---

---

---

---

---

### Processors With Greater Gain

---

---

---

---

---

---

---

### Processors with Greater Gain

- Useful for patients with some sensorineural component to their hearing loss
- Bone conduction threshold < 55 dB

---

---

---

---

---

---

---

### Automatic Multiband Adaptive Directionality

■ **Multiband:** 4 frequency channels

■ **3 modes**

- No directionality (omni / surround)
- **Split (High Frequency) directionality**
- Full directionality

■ **Automatic selection** between the **3 modes** based on sound level and best SNR

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Benefit from Processor Itself

- Loss of head shadow effect
- Improved hearing in noise
- No need for additional hardware for single sided deafness

---

---

---

---

---

---

---

---

### Continued Challenges with Processors

- Sound localization still poor
- Tinnitus is not alleviated

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Transcutaneous Options

---

---

---

---

---

---

---

### Transcutaneous Options

---

---

---

---

---

---

---

### Benefit of Transcutaneous Options

- No visible components when not in use
- Less likelihood of delayed skin reactions
- Failure of osseointegration with extrusion not a risk
- Feedback not an issue

---

---

---

---

---

---

---

## Cochlear Attract

Can Convert to Percutaneous device

---

---

---

---

---

---

---

## Are They Equivalent?

---

---

---

---

---

---

---

## Sophono

Transcutaneous Energy Transfer Processor

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Personal Anecdotal Feedback

- Patients generally happy regardless of device
- Consistent usage rate is over 95%
- Patient satisfaction rate between percutaneous vs. transcutaneous device

---

---

---

---

---

---

---

### Transcutaneous Devices: Challenges

- Adequate gain for elevated bone conduction thresholds.
- Sound localization
- Hearing in noise
- Tinnitus

---

---

---

---

---

---

---

### The Frontiers for Single Sided Deafness (SSD)

- Cochlear Implants

---

---

---

---

---

---

---

### CI's for SSD

- Confusion regarding sound input?
- Latency in sound processing?

---

---

---

---

---

---

---

### Realized Benefits of CI for SSD

- Eliminates head shadow effect
- Spatial hearing is improved
- Speech perception in noise improved
- Tinnitus suppression

---

---

---

---

---

---

---

### Caveats

- Follows auditory training
- Requires significant auditory rehabilitation

---

---

---

---

---

---

---

### Obstacles to CI's for SSD

- Cost
- FDA approval
- Cost
- Cost

---

---

---

---

---

---

---

### Any Questions?

---

---

---

---

---

---

---
